Psychological Solutions to Social Problems

By JACOBO A. VARELA
Montevideo, Uruguay

This book uses findings from many different areas of the social sciences to develop solutions to social and interpersonal problems in daily life—solutions which are independent of any prevailing philosophy or idealogy because they are derived from the fundamental processes of human nature discovered by social scientists. The author emphasizes that the methods used in the book are the same as those used in the applied physical sciences and engineering, and that the results have the same validity. Features of the book include:

- Techniques for appraising both strangers and associates.
- Methods of persuasion in both simple and complex matters.
- Effective techniques of group leadership.
- Methods for resolving conflicts without recourse to threats, violence, or to the usual mediation or arbitration procedures.

The concepts which are drawn in formulating these techniques include: cognitive dissonance, reactance and the latitude of rejection, immunization, approach-avoidance, Guilford's Structure of the Intellect Model, the approval motive, learning theory, and communication theory. Concrete examples are taken from business and industrial situations, but the principles derived have general applicability. The author concludes with an outline of a new social system which is based on the material presented earlier in the book.
